Approach Training

Move your aircraft on an approach, to a runway takeoff point, on a helipad, a gate or parking position or any other custom geographical location you choose.

Airport Selection

There are two options to select an airport.

Directly by ICAO Code

Airport ICAO: Random

Just enter the ICAO code of the airport in the corresponding field and the airport will load immediately.

Alternatively you can also use the button Random to choose a random airport.

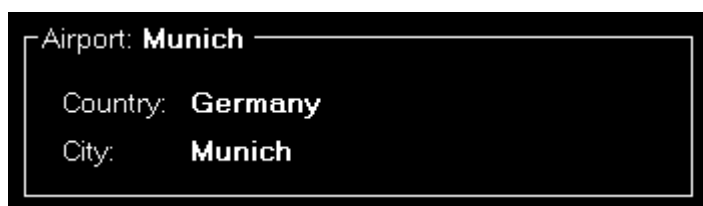

Search for Airport

Search for Airport

Click on this button to open the [Select Airport](#) dialog.

Airport Information

Airport: **Munich**
Country: **Germany**
City: **Munich**

Here you can see the name, country as well as city of the currently selected airport.

Runways or Helipads

Now you can choose on which runway or helipad you want your aircraft to be place.

 **Note:** This selection can also be directly accessed by the keyboard shortcut N.

Runway/Helipad Information

After selecting a runway some additional information about this runway is displayed.

For helipads this information is not displayed before you choose a specific helipad in the next step.

Approach Training

 **Note:** This option is only available if you chose a runway.

To start an approach training just click on one of the button to place your aircraft it the corresponding position.

If the runway is ILS enabled the correct altitude above ground will be calculated using the runway-specific glideslope degree. Otherwise the default of 3° will be used.

All parameters like distance to landing point for the two final positions, distance for the base positions or altitude above ground for the downwind positions can be configured in the [Settings](#) module.

Helipads

 Note: This option is only available if you chose Helicopter.

Click on one of the helipad buttons to place the aircraft on a helipad.

SID and STAR Waypoints

SID and STAR Waypoints

Procedure Type:

- ☒ Standard Instrument Departure (SID)
- ☐ Standard Terminal Arrival Route (STAR)
- ☐ Approach Transition (APPTR)
- ☐ Final Approach (FINAL)

Procedure Ident:

ALG2E.08R.ALG	↑
ANKE9E.08R.ANKER	=
BIBA2E.08R.BIBAG	
EVIV3E.08R.EVIVA	
GIVM5E.08R.GIVMI	
INPU2E.08R.INPUD	
KIRD2E.08R.KIRDI	
MERS1P.08R.MERSI	↓

You can place your aircraft directly on a waypoint of a Standard Instrument Departure (SID) or Standard Terminal Arrival Route (STAR).

First select which the desired procedure type - SID oder STAR - and then the procedure ident. Finally you can select one waypoint of the procedure you have chosen.

SID and STAR Waypoints

Procedure Type:

- ☒ Standard Instrument Departure (SID)
- ☐ Standard Terminal Arrival Route (STAR)
- ☐ Approach Transition (APPTR)
- ☐ Final Approach (FINAL)

Procedure Ident: **BIBA2E.08R.BIBAG**

Waypoint Ident: **RATGI**

Move Aircraft to Waypoint

Now click on the button **Move Aircraft to Waypoint** to change the aircraft position accordingly.

 **Note:** The aircraft will be automatically set in a way that the heading matches the direction to the next waypoint in the procedure.

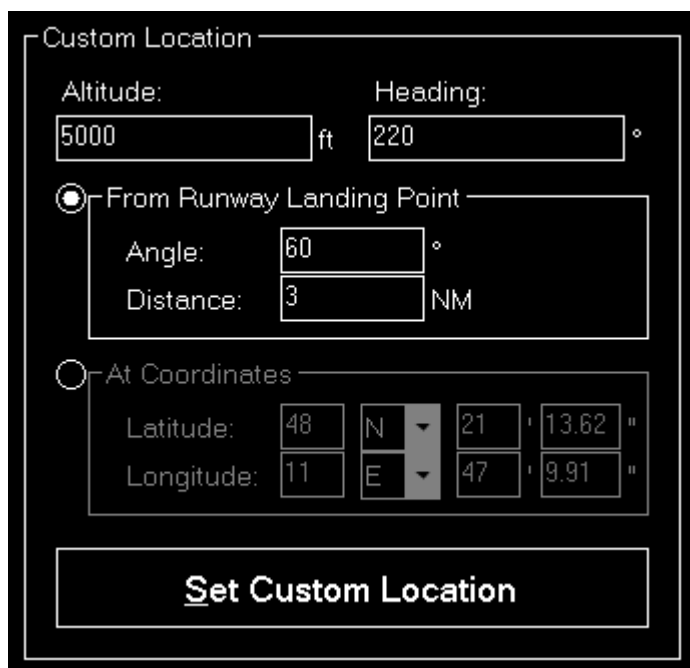

Airworks

Choose one of four pre-defined flight levels to start your airworks.

Of course, also these altitudes can be easily changed in the [Settings](#) module.

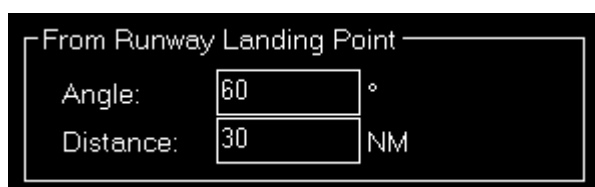

Custom Location

A screenshot of the 'Custom Location' settings panel. It has a dark background with a light blue border. At the top, it says 'Custom Location'. Below this, there are two input fields: 'Altitude:' with a value of '5000' and a unit of 'ft', and 'Heading:' with a value of '220' and a degree symbol. Below these, there are two radio button options. The first is 'From Runway Landing Point', which is selected. It has sub-fields for 'Angle:' (60 degrees) and 'Distance:' (3 NM). The second option is 'At Coordinates', which is unselected. It has sub-fields for 'Latitude:' (48 N 21 13.62) and 'Longitude:' (11 E 47 9.91). At the bottom, there is a large button labeled 'Set Custom Location'.

If you want your aircraft to be placed at a completely custom location, this is the right section for you.

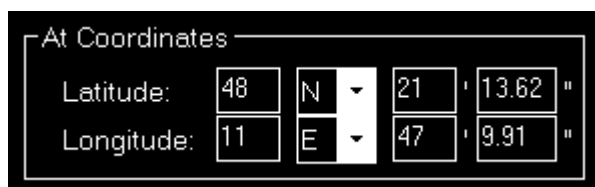

First enter the desired altitude (above MSL) and heading of the aircraft. Then you can choose from two options to define the position.

From Runway Landing Point

A screenshot of the 'From Runway Landing Point' settings panel. It has a dark background with a light blue border. At the top, it says 'From Runway Landing Point'. Below this, there are two input fields: 'Angle:' with a value of '60' and a degree symbol, and 'Distance:' with a value of '30' and a unit of 'NM'.

Using this option the aircraft will be move a definable distance away from the runway landing point in the entered direction.

At Coordinate

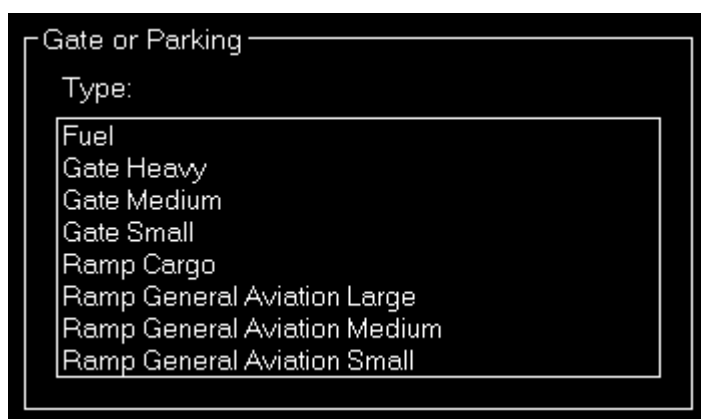

At Coordinates

Latitude:	48	N	21	13.62	"
Longitude:	11	E	47	9.91	"

Or you can just enter the exact geographic coordinates manually where you want the aircraft to be place.

The fields are pre-filled with the coordinates of the currently loaded airport.

Gate or Parking

Gate or Parking

Type:

- Fuel
- Gate Heavy
- Gate Medium
- Gate Small
- Ramp Cargo
- Ramp General Aviation Large
- Ramp General Aviation Medium
- Ramp General Aviation Small

You can also place your aircraft on a gate or parking position.

Therefore first select the type and then a specific gate or parking.

Gate or Parking

Type: **Gate Medium**

Gate or Parking: **Gate 102**

Move Aircraft to Gate or Parking

And then click on the button Move Aircraft to Gate or Parking to finally place the aircraft.

Options

Options

IAS: kt ☒ Set Gear: ☒ Down ☐ Override Altitude: Set: ☒ HDG ☒ CRS

Pitch: ° ☒ Set Flaps: ° ft MSL ☒ ILS Frequency

Here you can find several options like speed and gear/flaps status that are used when placing the aircraft.

All options are saved upon change and can even be defined on a per-aircraft level when aircraft profiles are enabled in the [Settings](#) module.

 Note: When aircraft is placed on ground gear is always extended and ILS frequency can only be set obviously if the runway is ILS enabled.

Flight Situation Presets

Flight Situation Presets

Approach EDDM 5 NM	Approach New York	SID KLAX HOLTZ9
STAR KJFK PARCH1	Take Off LA 25R	Take Off Tegel 26L
Back	Add	Next
Reset Current Flight Situation		

Here you can save the current flight situation including aircraft position, altitude, speed, heading as well as pitch and bank angle.

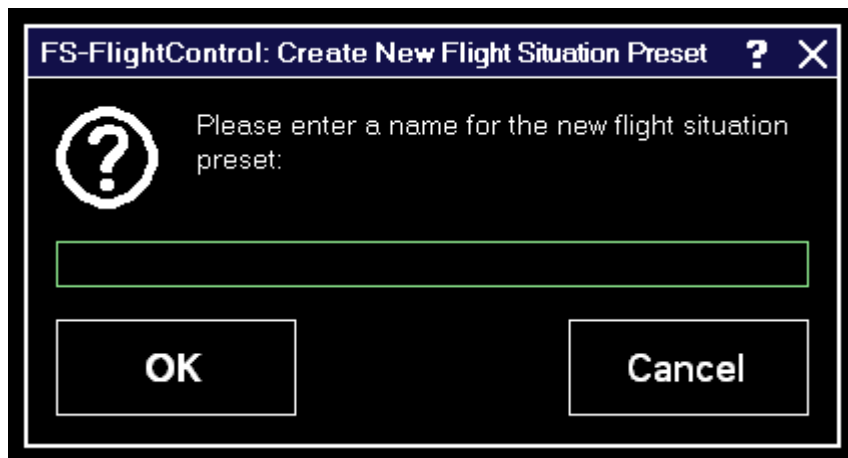

If there are more than 6 presets, you can page through them using the buttons Back and Next.

After clicking on the button Add to create a new situation preset or click on an existent one to send it to the flight simulator.

To reset the simulator you can use the button Reset Current Flight Situation.

 Note: For X-Plane this is only available starting from X-Plane version 11.10.

Create New Flight Situation Preset

When creating a new flight situation preset, you need to enter a name for it in this dialog.

Pop-Up Menu

If you right click (long “touch”) on a flight situation preset this pop-up menu will be shown enabling you to rename or delete an existent flight situation preset again.

Rename Flight Situation Preset

Here you can set a new name for an existent flight situation preset.

Landing Analysis

After you started an approach in this section your approach will be tracked.

The approach statistics starts automatically after the aircraft has been positioned on an approach with the Position module.

But you can enable the approach statistics also by choosing the airport you are currently approaching manually:

EDDM**ETSE****EDNX****EDML****EDMD**

Additionally you have the option to select a near airport directly by just clicking on the ICAO code of the airport that you want to approach.

 **Note:** Selecting an airport here does not change your aircraft position. This just provides you with the option to activate the approach statistics if you approach an airport manually without positioning your aircraft on an approach position first.

Approach Details

Approach Details		
Airport:	Munich (EDDM)	Runway: 08R
Visibility:	54.0 NM	Wind: 0 kt from 0°
Temp.: 15°C	Dew Point: 5°C	

This section shows some details about the current approach like the airport, runway and some visibility information.

Landing Report

Landing Report		
Distance:	677.78 ft.	G-Force: 1.0 G
Deviation:	144.39 ft. left	Pitch Angle: 2.24° up
Vertical Speed:	-717 ft./min.	Bank Angle: 9.63° left

After the approach has been completed and the aircraft is landed, this landing report shows detailed information about how well the landing was.

Localizer Deviation

The localizer deviation graph shows the horizontal deviation from the runway localizer (center of the runway) on your approach.

If the graph line goes to the top of the graph the aircraft is left from the localizer and if the line goes to the bottom the aircraft is right from the localizer.

Glideslope Deviation

On the lower approach graph the current aircraft altitude above mean sea level (MSL) as well as the ground altitude is shown.

The yellow straight line shows the ideal glideslope.

If the runway is ILS enabled the correct runway-specific glideslope degree will be used. Otherwise the default of 3° will be used.

Print Approach Statistics

Print Approach Statistics

The whole approach statistics can be printed with the button Print Approach Statistics.

Reset

Reset

Use the button Reset to reset the approach statistics again.
